

## Generator group

By using the strong power take-off of the Large Van ( $\pm 200$  Nm at 1500 rpm) we can offer a powerful compact generator placed under the car.

ACT offers for the Large Van a generating capacity of up to 30 KVA, 230 V or 400 V (optionally switchable), mono or three-phase.

The big advantage of these types of generators is that they can be fully installed at the underside of the vehicle. Thus, without the need for a special storage place. And at low cost and low weight.

Another great advantage is that the car's engine will be compatible with the latest Euronorm.
