

Transport of persons with reduced mobility

For transporting people with reduced mobility, ACT proposes various types of transformations.

Wheelchair elevators can be installed at the rear doors or at the side door. Depending on the vehicle type, we can determine with you which type of lift should be used.

The lift can be underfloor or can have a foldable platform for better access.

We offer an alternative solution with access ramps that can be installed in the rear. Depending on the available volume, we will model the access ramp, either in one piece or in two foldable parts.

For taxi services, we offer you a classic fastening system consisting of aluminium rails and fixation-belts, which can be combined with easily removable seats. The belts will be installed according to the European rules on seat attachment.
